SUSTAINABLE NEW COMMUNITIES PROGRAM

Guidebook

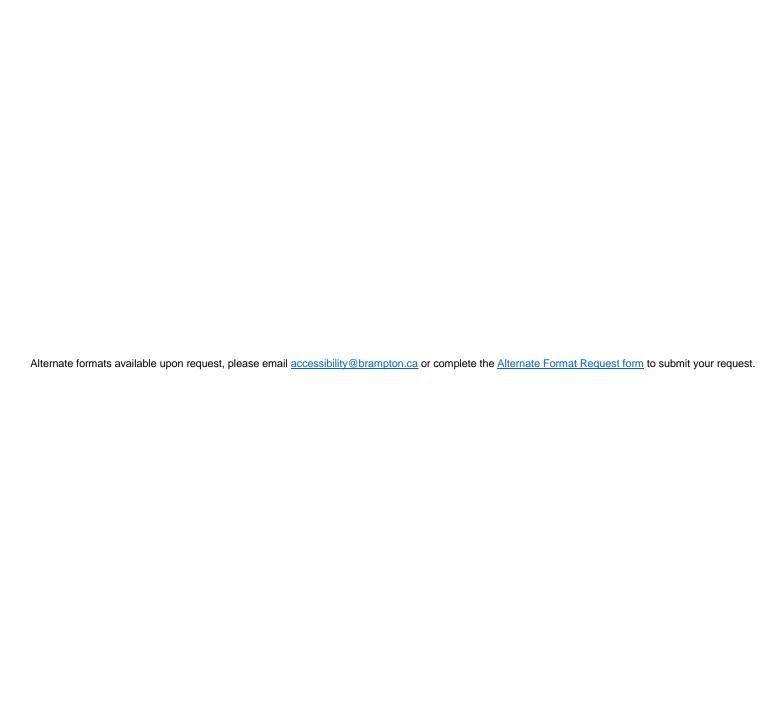

Over the last decades, cities and towns across the Greater Toronto and Hamilton Area (GTHA) have experienced significant and rapid growth. Municipalities play a pivotal role in responsibly managing growth and facilitating the development of communities that are environmentally, social, and economically sustainable.

To foster more sustainable new communities the Cities of Brampton, Vaughan, Richmond Hill, and Markham collaboratively offer a set of tools to evaluate and score the sustainability performance of development proposals, and encourage builders/developers to achieve a minimum level of performance. This includes:

a) Sustainability Metrics (Metrics):

A set of measures to encourage and evaluate the sustainability performance of new development, organized around the categories of Built Environment, Mobility, Natural Environment and Open Space, and Infrastructure and Building. Each of the over 120 Sustainability Metrics available to choose from are assigned a point value, and the combination of Metrics achieved in a development proposal results in a Sustainability Score (Score). Development proponents are able to select a combination of Metrics to achieve the minimum required Score. This enables the proponent to choose Metrics that best suit their individual property, project, and level of sustainability aspiration.

b) Sustainability Assessment Tool (SAT):

A digital tool that development proponents use to calculate the Sustainability Score by identifying the Metrics achieved in their development proposal.

Sustainability Score Thresholds (Thresholds):
 Performance levels achieved by the Sustainability Scores of a development proposal, and categorized as Bronze, Silver, or Gold.

The Sustainable New Communities Program (SNCP) is an important instrument to help implement both Provincial and Municipal land use planning, sustainability, and climate change goals and objectives. It facilitates creating healthy, complete, and sustainable communities that support quality of life for residents of all ages and abilities, energy efficiency and lower Greenhouse Gas (GHG) emissions, more efficient use of land and infrastructure, local economic development, and cultural and natural heritage conservation. The Program also offers flexibility that enables development proponents to choose the sustainability approaches that best suits their project.

This Sustainable New Communities Program Guidebook is a living document that will be updated from time to time. Please refer to the Program webpage of the respective municipality for the latest version.

SUBMISSION REQUIREMENTS

As part of a complete planning application submission, applicable development proposals are required to achieve a minimum Bronze Sustainability Score. In addition, as of January 1, 2023, development proposals must achieve the "Good" level of building energy and GHG emissions performance of Metric IB-12.

WHAT TYPE OF APPLICATIONS REQUIRED A SUSTAINABILITY SCORE?

- All Block Plans/Precinct Plans
- Plans of Subdivision of 10 more residential units
- "Full" Site Plans
- Zoning By-law amendments to facilitate any of the above

WHAT TYPE OF APPLICATIONS ARE EXEMPT?

- Plans of Subdivision of 9 residential units or less
- "Limited" and "Basic" Site Plans
- Plans of Subdivision for the purpose of subdividing large blocks of land for the sole purpose of creating lots for future employment, industrial, commercial, or institutional development, and which will require subsequent Site Plan approval.

DOES IT APPLY TO ZONING BY-LAW AMENDMENTS?

Yes. The Sustainability Score will be based on the preliminary information available at the Zoning By-law amendment stage. The score will then be refined when more details become available as part of the associated Plan of Subdivision and/or Site Plan applications.

IS THERE A MINIMUM REQUIRED SCORE?

Yes. Applications must achieve, at minimum, a Score that falls within the Bronze Threshold. In addition, as of January 1, 2023, development proposals must also achieve the "Good" level of building energy and GHG emissions performance of Metric IB-12.

	Bronze	Silver	Gold
Site Plan	41 - 61	62 - 75	76 - 241
Draft Plan	27 - 40	41 - 49	50 - 194
Block Plan	14 - 20	21 - 25	26 - 76

PRE-CONSULTATION APPLICATION

Applicants advised of Sustainable New Communities Program and associated minimum requirements.

PRE-CONSULTATION SUBMISSION

Complete application will include Sustainability Score & Summary and Snapshot. Application to achieve at least a Bronze Score, and as of January 1, 2023, the "Good" level of building energy and GHG emissions performance of Metric IB-12.

Staff assess plans/drawings and component studies in relation to the Sustainability Metrics and the Sustainability Score.

FORMAL SUBMISSION CIRCULATION / TECHNICAL REVIEW

Staff review plans/drawings and component studies to verify Metrics achieved and Sustainability Score.

INFORMATION REPORT

Staff report on application's Preliminary Sustainability Score.

RECOMMENDATION REPORT / SITE PLAN AGREEMENT

Staff report on application's Final Sustainability Score. Include Plan of Subdivisions or Site Plan condition(s) as applicable.

DETAILED DESIGN

Plans Demonstrate that Sustainability Score is being achieved.

The Sustainability Metrics are organized into four main categories: Built Environment, Mobility, Natural Environment and Parks, Infrastructure and Buildings. A new category, Innovation, has also been added.

Built Environment (BE)

The indicators for Built Environment speak to how we inform places and connections within the development. The intensity and diversity of land uses influences decisions on where we live, work, and how we move around the community. A mix of housing types, amenities, and employment and livework opportunities located within walking distance provides the opportunity for residents to meet their day-to-day needs without reliance on the private automobile. Further provision for life-cycle housing and accessible buildings allows residents to establish and remain in their communities throughout the various periods of their lives.

Mobility (MB)

The indicators of Mobility identify how a variety of transportation options must be available to residents to carry out their daily lives within and beyond the community. A sustainable community is one that encourages physical activity, facilitates active transportation, and supports public transit in place of automobile dependence. The most vulnerable population groups (children, elderly, disabled, and low income individuals) are the most affected by choices available to them for mobility and access to services and amenities. Designing a safe, convenient, and accessible environment for walking and cycling encourages these modes of transportation. Emphasis on mobility and active transportation not only reduces energy use and GHG emissions, but contributes directly to improving public health and the quality of life of residents as well.

Natural Environment and Parks (NE)

The natural heritage, urban forest, and the open space system are essential components of a healthy, sustainable community. The preservation and enhancement of the natural heritage system ensures the health of the environment and supports recreational and cultural opportunities, as well as climate change mitigation and adaptation in a community. Secondly, ensuring residents have convenient access to a connected and diverse range of natural heritage features, parks, and open space offers opportunities for improved public health and connections within the community.

Infrastructure and Buildings (IB)

The Infrastructure and Buildings indicators identify the means to maximize energy and water conservation, improve energy efficiency, and minimize GHG emissions and the consumption of non-renewable resources. New buildings and communities should be designed with a focus on reducing water, waste, and energy use. Since human activity is the principal cause of elevated levels of greenhouse gases and demands on energy, water, and waste systems, the measures focus on means of reducing this impact on both the built and natural environments.

Innovation (IN)

The Innovation indicator is intended to encourage true innovation resulting in significant sustainability benefit. This new theme allows flexibility to propose innovative sustainability measures that are not specifically captured but which provide a measurable sustainability benefit. This flexibility is intended to allow users to think progressively and outside of the box when proposing sustainability measures for their development proposals.

Indicators

The following are the performance indicators organized by category. Each performance indicator has associated Metrics that are allocated a point value. The Metrics reflect characteristics of a sustainable community and are designed to outline the required measures or standards for each category to ensure that the overall objectives of the Sustainability Metrics are achieved.

	BUILT ENVIRONMENT	N	OBILITY	N	IATURAL ENVIRONMENT AND PARKS

BE-5: CULTURAL HERITAGE CONSERVATION						
Intent:	Intent: To conserve cultural heritage resources, including built heritage resources (listed or designated), cultural heritage landscapes (listed or designated), and archaeological resources.					
Applicable to:	×	l Block Plan	☑ Draft Pla	an of Subdivision	⊠ Site Plan	
дригавис то.	×	Residential	⊠ I	Mixed Use	☑ Industrial, Commercial, Institutional	
	Points	Requireme	ent		Documentation	
Excellent:	3 points	The cultural heritage resource is conserved, and no elements that contribute to its cultural heritage value are demolished, removed, or relocated (excluding temporary removal for restoration purposes).		In the Cultural Heritage Impact Assessment, Heritage Conservation Plan and/or other documents acceptable to the municipality, provide: An outline of the cultural heritage attributes that contribute to the cultural heritage value and confirm that no portions of the resource that contribute to its cultural heritage value are to be demolished, removed, or relocated. Note: For the purposes of this metric, "conserved" means: The identification, protection, management and use of cultural heritage resources in a manner that ensures their cultural heritage value or interest is retained under the Ontario Heritage Act. This may be achieved by the implementation of recommendations set out in a Cultural Heritage Impact Assessment, Heritage Conservation Plan, Archaeological Assessment, and/or other documentation accepted by the municipality. Mitigated measures and/or alternative development approaches can be included in these plans and assessments. Conservation and conserve have corresponding meanings. The Standards and Guidelines is the guiding document for the conservation of cultural heritage resources in Canada.		
Great (*):	2 points	A portion of the cultural heritage resource is retained, and the integrity of the cultural heritage resource is conserved.		 cultural heritage resources in Canada. In the Cultural Heritage Impact Assessment, Heritage Conservation Plan, and/or other document accepted by the municipality, provide: An outline of the attributes that contribute to the cultural heritage value, identification of the portion(s) of the cultural heritage resource to be conserved, and rationale demonstrating that the integrity of the cultural heritage resource is being conserved. Note: (*) This metric is not applicable for Block Plans. For the purposes of this metric, "integrity" means: A measure of its wholeness and intactness of the cultural heritage values and attributes. Examining the conditions of integrity requires assessing the extent to which the property/cultural heritage resource includes all elements necessary to express its cultural heritage value; is of adequate size to ensure the complete representation of the features and processes that convey the cultural heritage resource's significance; and the extent to which it suffers from adverse affects of development and/or neglect. 		

			 Integrity should be assessed within the Cultural Heritage Impact Assessment, or other documentation accepted by the municipality. 	
Good:	1 point	Where a cultural heritage resource is being relocated, it is being moved to a visually prominent location within the proposed development.	In the Cultural Heritage Impact Assessment, Heritage Conservation Plan and/or other documents acceptable to the, identify: The proposed location of the cultural heritage resource that ensures its visual prominence.	
Good (*):	1 point	Where reusable materials from a cultural heritage resource is being removed, a portion is being salvaged and reused within the proposed development.	In the Cultural Heritage Impact Assessment, Heritage Conservation Plan and/or other documents acceptable to the municipality identify: The materials that will be salvaged and how they will be reused on site. Note: (*) This metric is not applicable for Block Plans. The reuse of the salvaged materials should also be demonstrated in appropriate supporting documents (e.g. site plan drawings, landscape plan).

For the requirements of the			

Excellent:	2 points	At least 50% of the parking spaces are designed and constructed to permit future EVSE installation (e.g. roughin).	 metric, applicants are encouraged to consult with the local municipality to determine the appropriate level or equivalent for EVSE. Rough-in provisions are defined as empty raceways starting in a junction box in the electrical room and terminating in a junction box central to each parking floor. Raceways will be empty to accommodate future wiring. Establishing electric vehicle charging stations are achieved by agreement at the development stage and implementation at the building stage. It is important for developers and builders to agree to install electrical vehicle charging stations prior to commitment.

			 Designate a 2 meter by 2 meter wall area in the electrical and mechanical rooms for future solar electrical/thermal equipment controls and connections (e.g. meters, monitors). Where possible place the HVAC or other rooftop equipment on the north side of the roof to prevent future shading. For more guidance on solar readiness, or to access a Solar Readiness Checklist, consult with NRCan Solar Ready Guidelines. Applicants are also encouraged to consult the National Renewable Energy Laboratory's Solar Ready Buildings Planning Guide for additional considerations for PV-ready provisions.
Great:	2 points	In the project, 1% of the total energy is generated on-site by renewable energy sources.	Letter of Commitment signed by a qualified professional (e.g. architect, professional engineer) and the owner/developer/builder to confirm the percent (%) of renewable energy will be generated on-site. The percent (%) of renewable energy generated can be quantified by the following steps:
Excellent	+1 additional point per percent (%) increase up to 5 points (total 7 points)	In the project, more than 1% of the total energy is generated on-site by renewable energy sources, up to 5%.	 List the types of building(s) (office, commercial, retail, residential multi-unit and/or single-unit). Determine the total Gross Floor Area (GFA) for each building type and list the expected/approximate energy use intensities (EUIs) for each building type. Determine the total building annual energy use for the site. List the renewable energy technologies being considered for the site. Determine the expected annual energy generated from renewable technologies and the percent (%) of annual energy generated on-site, relative to the total energy consumed. Note: Allowable forms of renewable energy systems include the following: Solar photovoltaics (PV) technologies (e.g. solar panel, solar shingles), Solar thermal, Biogas and biofuel, Wind-based systems. For greater clarity, it should be noted that geo-exchange systems (e.g. ground-source heat pumps) are considered a building energy efficiency measure, as opposed to a form of renewable energy generation. As such, these systems cannot be used for the on-site renewable energy requirement, but can instead be utilized to meet the energy efficiency targets. The renewable energy calculations can be conducted either within the wholebuilding energy modelling software or through recognized third-party energy modelling tools such as RETScreen Expert or PVSyst. Off-site solutions such as renewable energy certificates (RECs), carbon offsets, or power purchasing agreements (PPA) with renewable energy generators are not permitted to satisfy this measure unless otherwise approved by the City.
Good Target (Draft Plan Only)	3 points	For greenfield sites that provide ground-oriented development, 100% of dwellings in the project are designed for solar readiness.	Letter of Commitment signed by a qualified professional (e.g. architect, professional engineer) and the owner/developer/builder confirming that all dwellings in the project will be designed for solar readiness, and the measure that will be taking to facilitate this. Note:

	 This metric is not applicable to Industrial, Commercial, Institutional development 	ts.

Develop a whole-building energy model and design the building to achieve the following whole-building performance metrics associated with a near-net zero emissions level of performance: Total Energy Unit Intensity (TEUI): 75 kWh/m²/yr Thermal Energy Demand Intensity (TEDI): 15 kWh/m²/yr Greenhouse Gas Emissions Intensity (GHGI): 5 kgCO2/m²/yr All Other Part 3 Buildings Develop a whole-building energy model and design the building to achieve at least a 50% improvement in energy efficiency over the Ontario Building Code (OBC) SB-10, Division 3 (2017) reference building.	
Good:	3 points	Install electricity and/or thermal sub-meters for all energy end-uses that represent more than 10% of the building's total energy consumption, following the requirements laid out in LEED v4 Reference Guide Advanced Energy Metering credit. For buildings with multiple tenants, provide energy sub-metering for each commercial/institutional tenant, and per residential suite.	Letter of Commitment signed by a qualified professional (e.g. architect, professional engineer) and the owner/developer/builder identifying sub-metering that will be provided, accompanied by electrical and mechanical single line diagrams that indicate the provision of electricity and thermal sub-meters. A metering plan listing all meters along with type, energy source metered, diagrams, and/or references to design documentation.

Great:	3 points	Building Commissioning Conduct best practice commissioning, per the requirements referenced in LEED BD+C v4 Fundamental Commissioning and Verification pre-requisite. (Building commissioning is a systematic process of verifying that the various building sub-systems such as building envelope, mechanical (HVAC), plumbing and lighting systems are constructed and operational per the project requirements and design intent.)	Letter of Commitment signed by the owner/developer/builder confirming that building commissioning will be carried out per the requirements of LEED v4 BD+C Fundamental Commissioning and Verification pre-requisite.
Excellent:	4 points	Airtightness Testing Conduct a whole-building air leakage test to improve the quality and airtightness of the building envelope.	Letter of Commitment signed by the owner/developer/builder that an airtightness testing provider will be retained to conduct a whole-building air leakage test. Note: It is recommended that applicants follow ASTM WK35913 Standard Test Method for Determining the Air Leakage Rate of Large or Multi-zone Buildings or US Army Corps of Engineers (USACE) Air Leakage Test Protocol. Projects will conduct an operational envelope airtightness test under negative pressure producing a multi-point regression. However, projects are permitted to pursue negative and positive pressure testing and produce a building envelope test where HVAC-related openings are excluded as in the Passive House standard. Projects will target a test pressure of 75Pa. Projects unable to achieve 75Pa must follow either ASTM W35913 alternative test methods; Repeated Single-Point Test or a Repeated Two-Point test and demonstrate compliance using projected curves for airtightness at 75Pa. If the whole building cannot be tested as one zone, it is acceptable to test a zone that can be partitioned temporarily with adjacent zones "Guarded" as buffer zones using blower door equipment. Note that the air leakage rate should be normalized to the exterior surface area and not include the guarded surface areas. All materials, assemblies, and systems that form the continuous air barriers systems must be installed including any HVAC equipment, ducts, and fittings included in the test boundary. Upon completion, the applicant shall provide a completed airtightness testing report to City officials. For low-rise developments, conduct airtightness testing for 15 percent of the dwellings.

On the Floor Plans, identify the common refuge area. Note: (*) This metric is not applicable to Industrial, Commercial, Institutional developments. Applies to residential buildings that contain central amenity/lobby space. A refuge area should be a minimum size of 93 square meters (1000 square feet) and/or 0.5 square meters per occupant, and may act as building amenity space during normal operations. Common refuge areas are temporarily shared, lit spaces where vulnerable residents can gather to stay warm or cool, charge cell phones and access the internet, safely store medicine, refrigerate basic food necessities, access potable water and toilets, and perhaps prepare food.
Great	3 points	72 hours of back-up power to essential building systems is provided.	Letter of Commitment signed by a qualified professional (e.g. architect, professional engineer) and the owner/developer/builder stating that at least 72 hours of back-up power to essential building systems will be provided. Note: Provide a 72 hour minimum back-up power system, preferably using a non-fossil fuel source, to ensure power is provided to the refuge area, building security systems, domestic water pumps, sump pumps, at least one elevator, boilers and hot water pumps to enable access and egress and essential building functions during a prolonged power outage. Applies to multi-unit residential buildings only.

		IB-15: EXTREME WIND	PROTECTION FOR GRO	OUND-ORIENTED DEVELOPME	NT	
Metric Intent:	To increase the resis	stance of homes to the impacts of hig	gh wind events, and make t	them more resilience to the impa	cts of climate change.	
Applicable to:		☐ Block Plan	☑ Draft Pla	an of Subdivision	⊠ Site Plan	
Аррисавіе іо.		☑ Residential	⊠!	Mixed Use	☑ Industrial, Commercial, Institutional	
	Points	Requireme	ent		Documentation	
Good:	2 points	Requirement Roof to Wall Connections: Roof rafters, roof trusses or roof joists are tied to load-bearing wall framing in a manner that will resist a factored uplift load of 3 kN. This measure requires adequate connection of the top plate to the supporting wall studs, combined with adequate continuous vertical load path. If continuous structural wall sheathing (see Measure A.2.3) is not applied, then a top-to-bottom inspection to address all potential weak links in the continuous vertical load path using additional tires, straps or related measures should be applied. AND When engineered connectors are used, truss manufacturers will be requested to supply appropriate roof-to-wall connections along with trusses. Stud to Sill Plate Connection: Metal straps or connectors are used to connect lower storey wall studs to the sill plate.		engineer) and the owner/develor connections will be provided as Note: Builders should request the connectors along with trus	nat truss manufacturers supply appropriate roof-to-wall sses.
